

# Matter and Energy

## Matter

Material that has mass and takes up space

## Energy

The ability to cause changes in factors like temperature, height, or speed

**The universe contains matter and energy.**

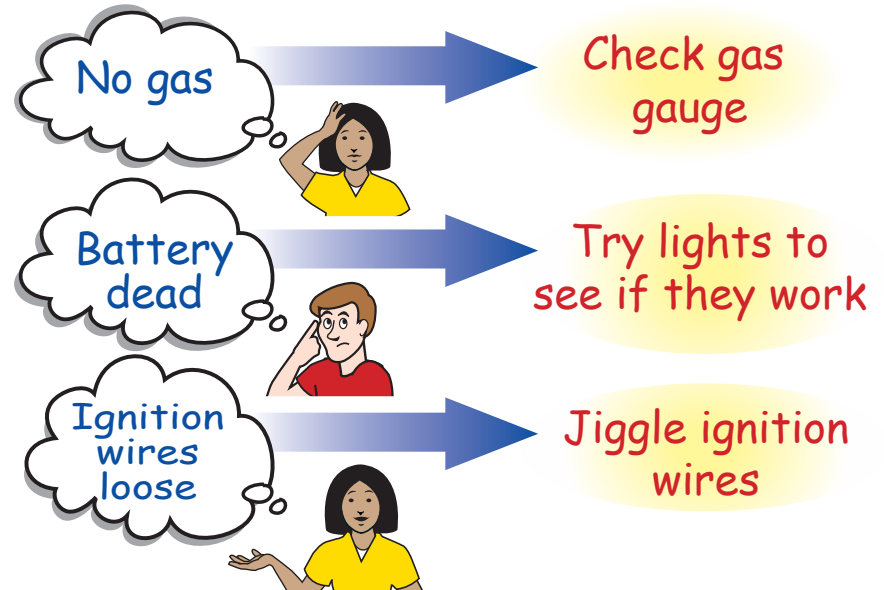

# Scientific Method

Why doesn't the car start?

Hypothesis

Experiment

## Steps in the scientific method

STEP	EXAMPLE
1. Ask a question.	1. <b>Why doesn't the car start?</b>
2. Formulate a hypothesis.	2. <b>Maybe the battery is dead.</b>
3. Design and conduct an experiment.	3. <b>Turn the lights on to test the battery.</b>
4. Collect and analyze data.	4. <b>The lights go on.</b>
5. Make a tentative conclusion.	5. <b>Battery is OK.</b>
6. Test conclusion, or if necessary, refine the question, and go through each step again.	6. <b>Are the ignition wires loose or wet?</b>

# Some Important Variables in the System

# Systems and Variables

**System includes:**  
car, ramp, angle,  
speed, time, mass

**Not included:**  
color, light, window,  
floor or friction  
(or anything else)

# How to Make a Graph

Position vs. Time

Make a scale for each axis  
x- axis:  
each box = 40  
y- axis:  
each box = 0.5

Create a title for your graph

Draw a smooth curve that shows the pattern of the data points

Plot the data points

Decide which variable to put on the x-axis and which to put on the y- axis.

# Solving Problems

Identify what the problem is looking for

Calculating gravitational forces

Use the following information to calculate the force of gravity between Earth and the moon.  
Mass of Earth:  $5.97 \times 10^{24}$  kg    Mass of moon:  $7.34 \times 10^{22}$  kg    Distance between centers of Earth and moon:  $3.84 \times 10^8$  m

**1. Looking for:** You are asked for the force of gravity between Earth and the moon.

Identify the information you are given

**2. Given:** You are given their two masses in kilograms and the distance between their centers in meters.

**3. Relationships:**  $F_g = G \frac{m_1 m_2}{r^2}$

Identify useful relationships

**4. Solution:**

$$F_g = (6.67 \times 10^{-11} \frac{\text{N} \cdot \text{m}^2}{\text{kg}^2}) \frac{(5.97 \times 10^{24} \text{ kg})(7.34 \times 10^{22} \text{ kg})}{(3.84 \times 10^8 \text{ m})^2}$$

$$F_g = (6.67 \times 10^{-11} \frac{\text{N} \cdot \text{m}^2}{\text{kg}^2}) \frac{(4.38 \times 10^{47} \text{ kg}^2)}{(1.47 \times 10^{17} \text{ m}^2)} = 1.99 \times 10^{20} \text{ N}$$

Solve the problem

**Your turn...**

- Calculate the force of gravity on a 50-kilogram person on Earth ( $6.38 \times 10^6$  m from its center). **Answer:** 489 N
- Calculate the force of gravity on a 50-kilogram person on the moon ( $1.74 \times 10^6$  m from its center). **Answer:** 81 N

Practice your problem-solving skills

# Speed

$$\begin{array}{l} \text{Speed} \rightarrow \mathbf{v} = \frac{\mathbf{d}}{\mathbf{t}} \\ \text{(m/sec)} \end{array} \quad \begin{array}{l} \leftarrow \text{Distance traveled} \\ \text{(meters)} \\ \leftarrow \text{Time taken} \\ \text{(seconds)} \end{array}$$

<b><i>You can calculate...</i></b>	<b><i>if you know...</i></b>	<b><i>Equation</i></b>
speed	distance and time	$\mathbf{v} = \frac{\mathbf{d}}{\mathbf{t}}$
distance	speed and time	$\mathbf{d} = \mathbf{v} \mathbf{t}$
time	distance and speed	$\mathbf{t} = \frac{\mathbf{d}}{\mathbf{v}}$

# Units of Force

## Newton

One newton (N) is the force it takes to change the speed of a 1 kg mass by 1 m/sec in 1 second.

Time

0.00

Time

1.00

## Pound

One pound (lb) is the force exerted by gravity on a mass of 0.454 kg.

# Net Force

## Forces in the horizontal direction

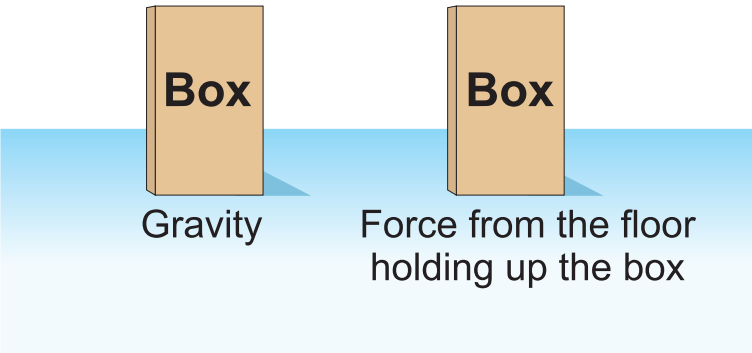

$$300 \text{ N} + 300 \text{ N} = 600 \text{ N}$$

→ + → = →

Net force = 600 N

## Forces in the vertical direction

$$\downarrow + \uparrow = 0$$

Net force = 0

# Newton's First Law of Motion

An object at rest will stay at rest and an object in motion will continue in motion with the same speed and direction UNLESS acted on by a force.

# Acceleration

$$\begin{array}{l} \text{Acceleration} \longrightarrow a = \frac{\text{Change in speed (m/sec)}}{t} \\ \text{(m/sec}^2\text{)} \end{array}$$

*t* ← Time (sec)

$$\text{Acceleration} = \frac{\text{Change in speed}}{\text{Change in time}}$$

**How do we get units of m/sec<sup>2</sup> ?**

**Plug in values**

$$\frac{50 \frac{\text{m}}{\text{sec}}}{\text{sec}}$$

=

**Clear the compound fraction**

$$50 \frac{\text{m}}{\text{sec}} \times \frac{1}{\text{sec}} = 50 \frac{\text{m}}{\text{sec} \times \text{sec}}$$

=

**Final units**

$$50 \frac{\text{m}}{\text{sec}^2}$$

# Newton's Second Law of Motion

$$\text{Acceleration (m/sec}^2\text{)} \rightarrow a = \frac{F}{m} \leftarrow \begin{array}{l} \text{Force (N)} \\ \text{Mass (kg)} \end{array}$$

$$a = \frac{F}{m}$$

$$a = \frac{F}{m}$$

$$a = \frac{F}{m}$$

# Average Speed

$$\begin{array}{l} \text{Average speed} \\ \text{(m/sec)} \end{array} \downarrow \quad \begin{array}{l} \text{Final speed (m/sec)} \\ \downarrow \\ \text{Initial speed} \\ \text{(m/sec)} \end{array} \leftarrow \begin{array}{l} \text{Initial speed} \\ \text{(m/sec)} \end{array}$$
$$V_{avg} = \frac{v_f + v_i}{2}$$

# Free Fall Distance

$$\begin{array}{l} \text{Distance (m)} \\ \downarrow \end{array} \quad \begin{array}{l} \text{Average speed (m/sec)} \\ \downarrow \end{array} \quad \begin{array}{l} \text{Time (sec)} \\ \leftarrow \end{array}$$
$$d = v_{avg} t$$

# Free Fall Speed (starting at rest)

Speed (m/sec)      Acceleration due to gravity (m/sec<sup>2</sup>)

$v = gt$

Time (sec)

# Free Fall with Upward Motion

The speed changes by  $-9.8 \text{ m/sec}$  every second

Time (sec)	Velocity (m/sec)	Height (m)
0.0	19.60	0.00
1.0	9.80	14.70
2.0	0.00	19.60
3.0	-9.80	14.70
4.0	-19.60	0.00

# Weight

$$F_g = mg$$

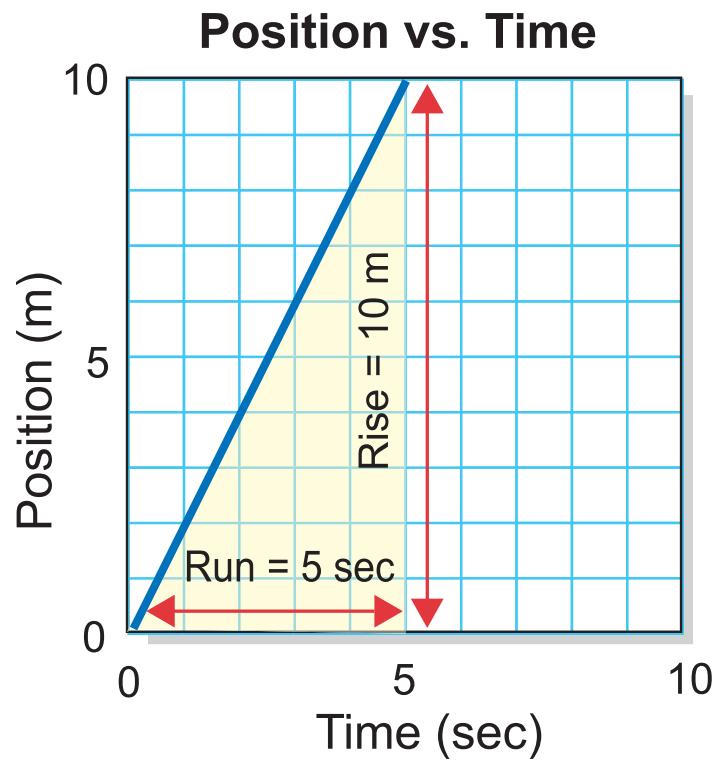

*Mass (kg)*

*Strength of gravity (9.8 N/kg)*

*Weight or force of gravity (N)*

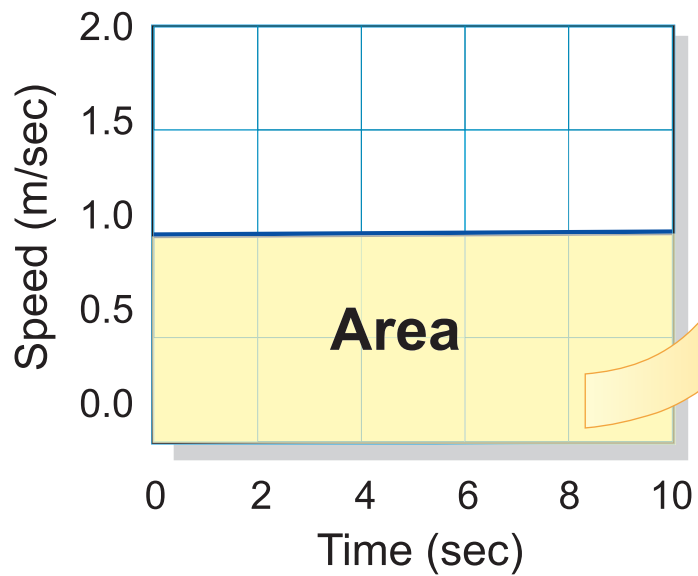

# Position vs. Time Graph

$$\begin{aligned}\text{Slope} &= \frac{\text{rise}}{\text{run}} \\ &= \frac{10 \text{ m}}{5 \text{ sec}} \\ &= \mathbf{2 \text{ m/sec}}\end{aligned}$$

The slope of position vs. time is the **speed.**

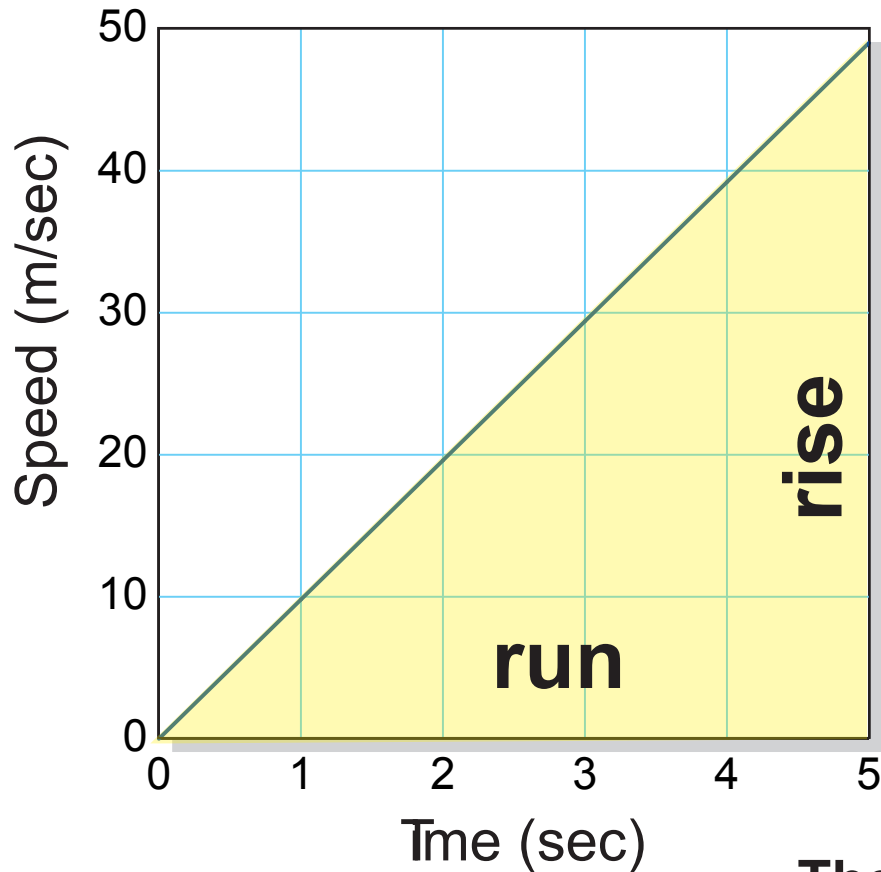

# Speed and Distance Traveled

$$\text{Area} = (10 \text{ sec}) \times (1 \text{ m/sec}) = 10 \text{ m}$$

Distance traveled

# Speed vs. Time Graph

$$\begin{aligned}\text{Slope} &= \frac{\text{rise}}{\text{run}} \\ &= \frac{49 \text{ m/sec}}{5 \text{ sec}} \\ &= 9.8 \text{ m/sec}^2\end{aligned}$$

The slope of speed vs. time is **acceleration**

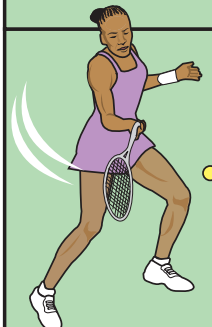

# Momentum

$$\begin{array}{c}
 \text{Mass (kg)} \\
 \downarrow \\
 \text{Momentum (kg}\cdot\text{m/sec)} \rightarrow \mathbf{p = mv} \\
 \uparrow \\
 \text{Velocity (m/sec)}
 \end{array}$$

**Before**

30 m/sec ← 0.1 kg  
 $p = -3 \cdot \text{kg m/sec}$

---

60 N force applied for 0.1 seconds  
**Impulse = +6 N·sec**

# Impulse

$$\begin{array}{c}
 \text{Time (sec)} \quad \text{Mass (kg)} \quad \text{Initial speed (m/sec)} \\
 \downarrow \quad \downarrow \quad \downarrow \\
 \text{Force (N)} \rightarrow \mathbf{Ft = mv_2 - mv_1} \\
 \uparrow \quad \uparrow \\
 \text{Impulse (N}\cdot\text{sec or kg}\cdot\text{m/sec)} \quad \text{Final speed (m/sec)}
 \end{array}$$

**After**

0.1 kg → 30 m/sec  
 $p = +3 \text{ kg m/sec}$

---

Change in momentum

$$+3 \frac{\text{kg}\cdot\text{m}}{\text{sec}} - (-3) \frac{\text{kg}\cdot\text{m}}{\text{sec}} = +6 \text{ N}\cdot\text{sec}$$

Impulse

# Newton's Third Law of Motion

For every action force, there is a reaction force equal in strength and opposite in direction.

# Potential Energy

*Potential energy*  
(joules)

*Mass* (kg)

$$E_p = mgh$$

*Height* (meters)

*Acceleration due to gravity* (9.8 m/sec<sup>2</sup>)

# Kinetic Energy

*Kinetic energy*  
(joules)

*Mass* (kg)

$$E_k = \frac{1}{2}mv^2$$

*Speed* (m/sec)

# Work

*Work* (joules)    *Force* (newtons)

$$W = Fd$$

*Distance* (meters)  
in the direction of the force

Lifting the 1 newton  
block 1 meter requires  
1 joule of work.
